Development of a Field Sick Call Medical Module for the Marine Corps

Introduction

The maintenance of a fit and healthy force is imperative to achieve mission success.¹ Historically, disease and nonbattle injury (DNBI) result in more loss of manpower and reduction of combat effectiveness than does trauma. Aggressive initiatives to control traditionally high rates of DNBI have yielded a gradually decreasing experience of outpatient morbidity for U.S. forces.^{2,3} This general trend over time can be attributed to a combination of factors, including aggressive preventive medicine efforts and comprehensive infrastructures of medical care.⁴

Central to ensuring a fit and healthy force is the provision of a readily available and effectively executed sick call capability. Currently, sick call capability is included in the Battalion Aid Station (BAS) Authorized Medical Allowance Lists (AMALs). The objective of this study was to support the creation of a stand-alone sick call capability. This paper describes the development of the Sick Call AMAL block using an objective, systematic methodology that identifies the clinical requirements for each individual supply providing that the highest level of clinical support is achieved with the fewest resources.

Background

Routine Health Service Support (HSS) of DNBI occurrences within the operational forces of the Marine Corps is addressed through regularly scheduled sick call. Operational sick call is supported by Class VIII medical materiel assemblages, which are the AMAL/Authorized Dental Allowance Lists tables of equipment. Sick call medical supplies for the Fleet Marine Force are stocked as a subset of materiel in the BAS AMALs 635 and 636.

The configuration of HSS sick call assets within AMALs 635 and 636 requires the BAS to perform two broad and somewhat incongruous missions. First, during times of high operational tempo, the BAS provides the medical assets required to treat seriously wounded combat casualties. Second, during the remaining time, the BAS provides the clinical assets for conducting sick call for the operational force. Because the BAS is a highly capable asset in both the role of combat casualty care and in the role of health maintenance provider for the operational force, transportation, utilization, and management of the BAS block has become challenging. These difficulties are particularly evident during operations where only a sick call function is required such as would occur during a routine training evolution where the addition of the combat casualty trauma care portion of the 635 and 636 would not necessarily be required to achieve the mission objective.

The difficulties associated with the configuration of the BAS AMAL blocks to meet two clinical objectives has been recognized by the Marine Corps leadership. The Marine Corps Combat Development Command responded with the drafting of an Operation Requirements Document (ORD) that proposes a solution that includes extracting the sick call capability from the 635 and 636 to create a new medical module that will function solely as a routine HSS health maintenance sick call provider for the force.

Method

To identify the sick call supplies, the Naval Health Research Center (NHRC) first reviewed Joint Readiness Clinical Advisory Board (JRCAB) patient conditions (PCs) to determine those PCs covering DNBI. Next, the rate that these DNBI PCs occur was determined. Third, a patient stream was fed into the Estimating Supplies Program (ESP) to determine the supplies necessary to treat sick call patients.

Review of JRCAB PCs

A review of the 317 JRCAB-approved PCs was conducted to identify the DNBI PCs. Of the 317, 111 PCs (35%) represented the most common type of patient encounters expected during nonhostile conditions and routine deployments (see Appendix A for a the list of DNBI PCs used in this study).

Determining the Rate of Occurrence

To determine the rate at which patients would experience one or more of the identified 111 PCs, the literature on operational health care in various environments was reviewed. The operational environments reported in these studies included Desert Shield/Storm, Somalia, peacekeeping missions, and shore activities. A range of DNBI rates from 5.8 to 14.0 patient visits per 100 troops per week was reported. A rate of 8.7 patient visits per 100 troops per week was selected as the rate for the most commonly anticipated scenarios.

Table 1 shows the breakdown of DNBI categories with the number of patients and percentages of occurrences.

Table 1. Number and Percentage of PCs by Category

Category	Number of Patients	% of Occurrence
Nonbattle Injury	57	27.29%
Gastrointestinal	32	15.31%
Dermatological	24	11.48%
Respiratory	23	11.00%
Infectious/Parasitic	22	10.50%
Neuropsychiatric	12	5.75%
Environmental	12	5.74%
Miscellaneous	11	5.27%
Genitourinary	9	4.31%
Eye/Ear Disease	4	1.91%
Sexually Transmitted Disease	3	1.44%
Female Specific		
Total	209	100.00%

The DNBI PCs do not include major trauma PCs. However, care for the major trauma conditions in sick call capability would include the “ABC’s” of initial stabilization followed by rapid evacuation to more definitive care locations. To provide care other than for “routine” sick call or initial stabilization is beyond the scope of care envisioned for the Sick Call module.

Entering the PCs in ESP

ESP is a user-friendly software program designed by NHRC to (1) calculate the amount of supplies required for an operational scenario using casualty estimates, level of care, and functional area; and (2) assess inventory readiness for a specific patient stream. This study used ESP to generate the consumables and equipment necessary to treat a patient stream of solely DNBI PCs.

First, the BAS was selected in ESP as the functional area expected to treat the patients. Second, the 111 JRCAB DNBI PCs were entered into ESP using the DNBI rate of 8.7 sick call encounters per 100 persons per week. This yielded a total of 209 sick call encounters over the simulated 30-day period for 600 troops or population at risk (PAR).

ESP distributed the 209 sick call PCs across the 111 JRCAB DNBI PCs using underlying FORECAS^a probabilities. Patient occurrence values greater than 1 were rounded to the nearest whole number. It should be noted that some probabilities are quite low for some of the disease conditions, especially when used to project occurrence rates with populations as low as 600 PAR. Therefore, some PCs had an absolute patient occurrence rate less than 1 per 600 PAR. In these instances, one of two approaches was used. If the occurrence was .5 or higher, the value was increased to 1 whole patient. If the occurrence was less than .5, the value was decreased to zero. However, the unique supplies required to treat that low probability event were added in sufficient quantity to treat a single patient.

Results

Sick Call Equipment Projections

ESP ran the projected DNBI patient stream through the BAS functional area and generated a list of projected sick call equipment. This resulted in ESP identifying 63 different pieces of equipment suitable for the administration of sick call. Of the 63 pieces of equipment, 28 were surgical instrument items. These surgical items are used in the BAS to conduct more intensive surgical procedures than would be required in a sick call capability. To address this excess capability, the minor surgical instrument set stocked in the corpsman medical bag was substituted for the 28 BAS items. The corpsman set consists of 11 minor surgical items encased in a single soft nylon cover. This substitution reduced the number of projected equipment items from 63 to 35.

The projected equipment was further examined to identify items that exceed the clinical requirements of a sick call capability. This examination resulted in the removal of spare laryngoscope

^a FORCAS is an NHRC developed ground casualty and DNBI projection tool based on the rates and medical incidence patterns observed in previous combat operations in combination with present-day weapons inventories and battlefield motivation of potential adversaries.

blades, the basic otoscope/ophthalmoscope (the deluxe otoscope/ophthalmoscope was retained), mercurial thermometers (hazardous material), oxygen administration equipment, restraint sets, mechanical suction apparatus, and surgical instrument stands. The removal of these items from the projected list reduced the number of clinically required items to 29. The final list of projected sick call equipment is shown in Appendix B.

The final list of projected equipment was then compared with equipment items recommended by the Fleet Operational Needs Statement (FONS). All but three items in the FONS list were included in the projected sick call list. These three items are a set of tracheal forceps, a medical backpack, and a bottle to hold and dispense cupric sulfate. Because these items are geared more to combat casualty care than sick call, they will be reintroduced for consideration when the BAS combat casualty care AMAL is reviewed. Next, the projected list was compared with the FONS to identify any items that the FONS did not include. This examination showed that the ESP projection identified 20 additional sick call items not cited in the FONS. Among these items were blankets, an otoscope/ophthalmoscope set, eye and wound irrigation basins, an AMAL can insert to hold the medicinals, and an automated external defibrillator.

A final comparison was conducted between the current BAS equipment block and the proposed sick call equipment module. Table 2 shows these results. It can be seen from Table 2 that the proposed sick call equipment module is approximately one quarter the size and cost of the current BAS equipment block.

Table 2. Comparison Between BAS and Sick Call Equipment Lists

	Items	Weight	Cube	Cost
Current 635 BAS Equipment	78	694.8	50.5	\$24,632.42
Proposed Sick Call Equipment	29	161.6	14.0	\$6,490.93
% Difference	-62.8%	-76.7%	-72.4%	-73.6%

Sick Call Consumable Projections

The DNBI PCs were also entered into ESP using the FORECAS probabilities to generate the proposed sick call consumable list. The functional area selected to run the consumable projections was the BAS. The list of consumable items generated by ESP was compared with the consumable items listed in the FONS to assess how much overlap existed between the two proposed lists. This examination showed that ESP projected a requirement for 44 consumable items not identified in the FONS. These 44 items are part of the final consumable list proposed by this study.

A second examination was conducted to determine how many of the items projected by the ESP output were also recommended by the FONS. This examination showed that of the 116 items in the FONS list, 82 (70.7%) were included in the ESP generated list. The remaining 34 items ($82 + 34 = 116$) consisted of those pieces of materiel that were not previously validated (i.e., not currently part of the BAS). Each of these 34 items was examined to assess its potential for assignment of a clinical requirement within the scope and mission of the sick call module as described in the ORD. Seventeen of the 34 items were found to either exceed the requirements of the sick call module (e.g., combat casualty care), were redundant with other materiel, or were considered 782 gear not traditionally maintained by Marine Corps medical assets. These items are shown in Table 3.

The quantities for each of these items, expressed as the unit of measure, are shown in the third column of Appendix C. These values are the quantities of each item required for the PAR over 30 days. Only those items previously validated (in ESP) are shown with a unit of measure. The units of measure were then configured into the most appropriate unit of issue package size. These data are listed in the fifth column and represent the final quantities proposed for the consumable portion of the Sick Call module.

A final comparison was conducted between the current BAS consumable list and the proposed Sick Call consumable module. Table 5 shows these results. It can be seen from Table 5 that the proposed Sick Call consumable module, while containing only 20% fewer items, is approximately one quarter the size and cost of the current BAS consumable block.

Table 5. Comparison Between BAS and Sick Call Consumable Lists

Proposed Sick Call Consumables	143	205.6	18.5	\$5,424.68
	Items	Weight	Cube	Cost
Current 636 BAS Consumables	180	675.7	71.6	\$22,520.43
% Difference	-20.6%	-69.6%	-74.2%	- 75.9%

Discussion

A stand-alone sick call capability was configured by identifying the clinical requirements for each individual supply. This Sick Call module can be used to treat DNBI likely to occur in field environments. While it addresses initial stabilization of the more severe trauma injuries, it does not require that the entire BAS block be deployed for all field settings.

Historically, DNBI results in more loss of manpower and reduces combat effectiveness than does trauma. The modularization and configuration of the BAS block to provide a sick call and/or a trauma treatment capability greatly enhances the ability of HSS to meet the needs of Battalion Commanders. Length of time before evacuation, nature and operational tempo of the unit's activity, health readiness of the deploying personnel, and available transportation assets are factors to consider when determining whether to deploy the entire BAS block or the Sick Call module only.

14. ABSTRACT (maximum 200 words)

Central to ensuring a fit and healthy force is the provision of a readily available and effectively executed sick call capability. Currently, Marine Corps sick call capability is included in the Battalion Aid Station (BAS) Authorized Medical Allowance Lists. The objective of this study was to support the creation of a stand-alone sick call capability. This paper describes the development of the sick call supply module using an objective, systematic methodology that identifies the clinical requirements for each individual supply, thereby providing the highest level of clinical support with the fewest resources. To identify sick call supplies, Naval Health Research Center (NHRC) first reviewed the Joint Readiness Clinical Advisory Board patient conditions (PCs) to determine those PCs covering disease and nonbattle injury (DNBI). Next, the rate that these DNBI PCs occur was determined using underlying casualty rate probabilities in the NHRC patient-generating model FORECAS. Third, a patient stream was fed into the NHRC Estimating Supplies Program to determine the supplies necessary to treat sick call patients. A total of 29 equipment and 143 consumable items were identified for the sick call module. An examination of these 172 items showed that 17 new medical items were added to the Marine Corps supply inventory, representing an enhancement to the administration of field sick call. Furthermore, the supplies in the sick call module are no longer co-mingled with the combat casualty care portion of the BAS. This stand-alone capability provides units greater flexibility in matching their medical supply support to their mission profiles and objectives.
